Electrooculography (EOG) Sensor Data Sheet

**SPECIFICATIONS**
- Gain: 2040
- Range: ±0.81mV (with VCC = 3.3V)
- Bandwidth: 0.05-41Hz
- Consumption: ~3mA
- Input Voltage Range: 1.8-5.5V
- Input Impedance: >100GOhm
- CMRR: 100dB

**FEATURES**
- Single-channel sensor
- Bipolar differential measurement
- Pre-conditioned analog output
- Small form factor
- Raw data output
- Easy-to-use

**APPLICATIONS**
- Human-Computer Interaction
- Eye gaze analysis
- Neurofeedback
- Sleep studies
- Neurophysiology studies
- Psychophysiology
- Biomedical devices prototyping

**GENERAL DESCRIPTION**
Our electrooculography (EOG) sensor has been especially designed for seamless EOG data acquisition. Either used by itself or in combination with an eye tracker, our sensor can provide an additional insight into your subjects' eye gaze patterns. The bipolar configuration, with two measurement electrodes detects the electrical potentials in the specific temporal or facial region of choice, with respect to a reference electrode (placed in an area of low bioelectrical activity). The resulting signal is the amplified difference between these two leads, eliminating the common unwanted signals. Its convenient form factor enables a discrete application in the typical EOG electrode placement locations.

---

BEWARE: DIRECT OR INDIRECT COUPLING TO THE MAINS MAY RESULT IN SHOCKING HAZARD

---

This information is provided “as is,” and we make no express or implied warranties whatsoever with respect to functionality, operability, use, fitness for a particular purpose, or infringement of rights. We expressly disclaim any liability whatsoever for any direct, indirect, consequential, incidental or special damages, including, without limitation, lost revenues, lost profits, losses resulting from business interruption or loss of data, regardless of the form of action or legal theory under which the liability may be asserted, even if advised of the possibility of such damages.
Electrooculography (EOG) Sensor Data Sheet

### TRANSFER FUNCTION

[-0.81mV, 0.81mV]

\[
EOG(V) = \frac{(ADC - \frac{1}{2^n}) \cdot VCC}{G_{EOG}}
\]

\[
EOG(mV) = EOG(V) \cdot 1000
\]

\[VCC = 3.3V\] (operating voltage)
\[G_{EOG} = 2040\] (sensor gain)

\[EOG(V)\] – EOG value in Volt (V)
\[EOG(mV)\] – EOG value in millivolt (mV)
\[ADC\] – Value sampled from the channel
\[n\] – Number of bits of the channel

### ORDERING GUIDE

<tr>
<td>SENS-EOG-SHER</td>
<td>Electrooculography (EOG) sensor with a Molex Sherlock 4-pin socket on one side and a Molex Sherlock 3-pin socket on the other for easy power and signal cable connection or pin breakout using PCB wires</td>
</tr>
</tbody>
</table>

1 The number of bits for each channel depends on the resolution of the Analog-to-Digital Converter (ADC); in BITalino the first four channels are sampled using 10-bit resolution (n = 10), while the last two may be sampled using 6-bit (n = 6).
